

# 50 / 60 Hz Loaded Line Locator The "Power-Pup"

- ▶ Push button between null and peak
- ▶ One Finger Sensitivity Control
- ▶ Wide-View easy to read meter
- ▶ Built in loudspeaker
- ▶ 6 AA Battery Operation
- ▶ Depth Gauge

After more than 40 years in operation, Aquatronics, Inc. still provides 72 hour turn around time in the service department.

# AT-9X

# AT-9X - Power Pup

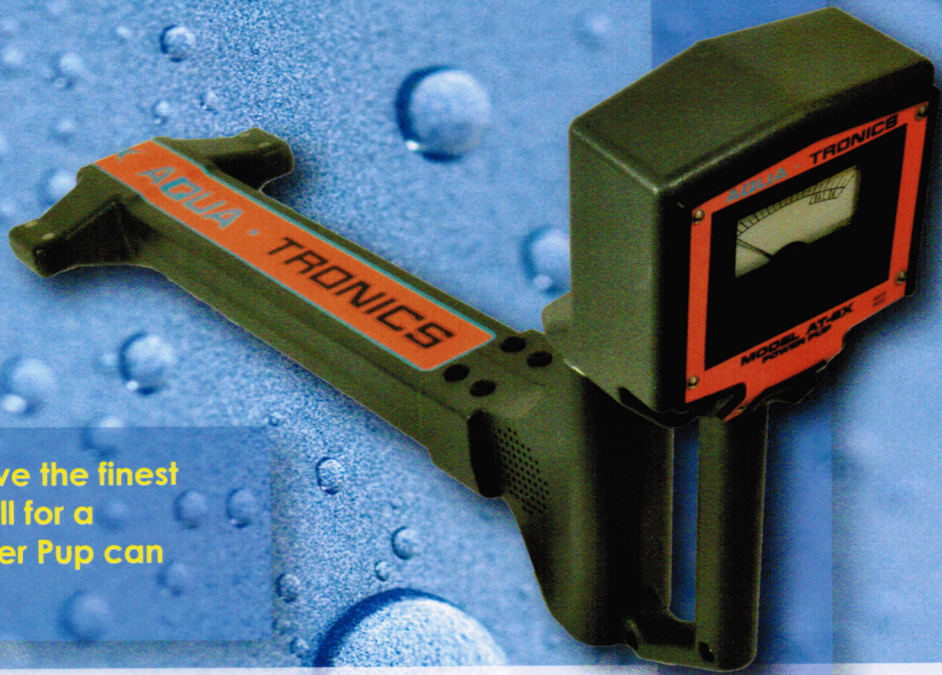

The AT-9X is a receiver that is used to locate electric power cables that have some type of a load current flowing in them.

Two precision-wound antenna's (one for null and one for peak) feed a "Q" enhanced circuit that is actually tuned to 50/60 Hz.

This allows the receiver to respont to electrical energy being radiated from buried cables that have very little load current. Unlike those multi-frequency instruments that use the same antenna for all frequencies and must tune to a harmonic of the 50/60 Hz energy band.

While observing the meter, or listening to the speaker, the operator can locate, trace and measure the depth of energized power cables. He can also locate low impedance cable fault, "T" or "Y" splices and buried or covered transformers.

With only a sensitivity (volume) control to adjust during a location, the Model AT-9X Power Pup is the ultimate in simplicity. Any person can be locating cables in just a few minutes after reading the small instruction manual supplied with each instrument.

**All manufacturers claim to have the finest instruments on the market. Call for a demonstration where the Power Pup can speak for itself.**
